

Uploading Nucleus AI to GitHub

This guide provides three easy ways to upload the Nucleus AI codebase to your GitHub account.

Prerequisites

- **Git** installed and configured with your name/email
- A **GitHub account** (<https://github.com>)

```
# Configure git (if not already done)
git config --global user.name "Your Name"
git config --global user.email "your-email@example.com"
```

Option A — Manual Method (GitHub.com UI)

Best if you prefer using the browser and don't have GitHub CLI installed.

Step 1: Create a New Repository on GitHub

1. Go to **<https://github.com/new>**
2. Fill in the details:
 - **Repository name:** `nucleus-ai`
 - **Description:** `Nucleus AI – Intelligent marketing platform with Context Vault, Multi-Agent Workflow Engine, and Attribution Engine`
 - **Visibility:** Private (recommended) or Public
 - **⚠ Do NOT** initialize with README, .gitignore, or license (the repo already has these)
3. Click **Create repository**

Step 2: Push the Code

After creating the repo, GitHub will show setup instructions. Run these commands in your terminal from the project root:

```
cd /path/to/nucleus-ai

# Add GitHub as remote (replace YOUR_USERNAME with your GitHub username)
git remote add origin https://github.com/YOUR_USERNAME/nucleus-ai.git

# Push all code
git push -u origin master
```

Note: If your default branch is `main` instead of `master`, use:

```
bash
git branch -M main
git push -u origin main
```

Step 3: Verify

Visit `https://github.com/YOUR_USERNAME/nucleus-ai` to confirm all files are uploaded.

Option B — Automated Script (Recommended)

The easiest method — a single script handles everything.

Prerequisites

Install GitHub CLI: `https://cli.github.com`

```
# macOS
brew install gh

# Ubuntu/Debian
sudo apt install gh

# Windows
winget install GitHub.cli
```

Then authenticate:

```
gh auth login
```

Run the Script

```
cd /path/to/nucleus-ai
./scripts/github-upload.sh
```

The script will:

1.  Verify you're authenticated
 2.  Ask for repository name (default: `nucleus-ai`)
 3.  Ask for visibility (default: private)
 4.  Create the repository on GitHub
 5.  Push all code automatically
-

Option C — GitHub CLI One-Liner

If you have `gh` installed and just want a quick upload:

```
cd /path/to/nucleus-ai

# Create repo and push in one go
gh repo create nucleus-ai --private --source=. --remote=origin --push \
  --description "Nucleus AI — Intelligent marketing platform"
```

Options:

- Replace `--private` with `--public` for a public repo
- Add `--disable-wiki` to disable the wiki tab

After Upload — Recommended Next Steps

1. Set Up Repository Secrets (for CI/CD)

Go to **Settings** → **Secrets and variables** → **Actions** and add:

Secret Name	Description
<code>OPENAI_API_KEY</code>	Your OpenAI API key
<code>DATABASE_URL</code>	Production database URL
<code>NEXTAUTH_SECRET</code>	NextAuth.js secret
<code>DOCKER_USERNAME</code>	Docker Hub username (for image publishing)
<code>DOCKER_PASSWORD</code>	Docker Hub access token

2. Branch Protection (Recommended)

Go to **Settings** → **Branches** → **Add rule**:

- Branch name pattern: `main` or `master`
- ☒ Require pull request reviews before merging
- ☒ Require status checks to pass
- ☒ Require branches to be up to date

3. Add Collaborators

```
# Via CLI
gh repo edit nucleus-ai --add-topic ai,marketing,fastapi,nextjs

# Add a collaborator
gh api repos/YOUR_USERNAME/nucleus-ai/collaborators/COLLABORATOR_USERNAME -X PUT
```

4. Enable GitHub Pages (Optional)

For hosting documentation from the `docs/` folder.

Troubleshooting

“remote origin already exists”

```
git remote remove origin
git remote add origin https://github.com/YOUR_USERNAME/nucleus-ai.git
git push -u origin master
```

“Permission denied”

- Ensure you’re authenticated: `gh auth status` or check SSH keys
- For HTTPS, you may need a [Personal Access Token](https://github.com/settings/tokens) (<https://github.com/settings/tokens>)

“Repository not found” on push

- Double-check the repository was created on GitHub
- Verify the remote URL: `git remote -v`

“Updates were rejected” (non-fast-forward)

This happens if the remote has content you don’t have locally:

```
git pull --rebase origin master
git push -u origin master
```

Large file errors

If you get errors about file size limits:

```
# Check for large files
find . -type f -size +50M -not -path "./.git/*" -not -path "*/node_modules/*"

# Consider using Git LFS for large files
git lfs install
git lfs track "*.pdf"
```

What Gets Uploaded

The repository includes:

Directory	Contents
backend/	FastAPI application (Python) — API, agents, database
frontend/	Next.js application (TypeScript) — UI, auth, dashboard
docker/	Production Dockerfiles
nginx/	Reverse proxy configuration
scripts/	Deployment & utility scripts
docs/	Deployment guides (AWS, GCP, Azure, DigitalOcean, self-hosted)
monitoring/	Prometheus configuration
.github/	CI/CD workflows

Excluded (via `.gitignore`):

- `.env` files with secrets
 - `node_modules/`
 - `__pycache__/`
 - `.next/` build output
 - Docker volume data
 - SSL certificates
 - Log files
-

For detailed project documentation, see [README.md](#) (README.md).
